

MYTHS & FACTS

MYTH

STRENGTH TRAINING IS ONLY FOR ATHLETES AND BODYBUILDERS

Fact: Strength training benefits Everybody, from young adults to seniors. It improves bone & muscle strength, metabolism, posture, and joint health, reducing the risk of injuries and conditions like osteoporosis. Studies show resistance training helps in managing diabetes, heart & lung health. This resistance can be weights at a gym or bodyweight at home or when travelling.

MYTH

LIFTING WEIGHTS WILL MAKE WOMEN LOOK MANLY.

Fact: Women have lower testosterone than men, making it nearly impossible to bulk up naturally. Strength training tones muscles, burns fat, & enhances body shape rather than causing excessive muscle gain. Increased muscle mass reduces and prevents fat storage in the body, which in turn leads to good hormone functioning & prevents PCOS & other hormone imbalances.

MYTH

DEADLIFTS AND SQUATS ARE BAD FOR THE KNEES AND LOWER BACK.

Fact: When done with proper technique, these exercises strengthen the legs, core, and spine, reducing knee and back pain. Stronger leg muscles lower arthritis risk & improve functional abilities. Everyone should learn these two exercises from a qualified coach (if required) and master them.

MYTH

HOW LONG SHOULD I EXERCISE TO BUILD STRENGTH AND MUSCLE?

Fact: Exercise should be part of your lifestyle for long-term health and well-being even when you are busy, travelling, or unable to visit your coach or don't have access to a gym. To build strength, 45-60 min of resistance training, 3-5 times a week is ideal. Once you've gained strength, you can maintain it 1-3 times a week, but stopping exercise entirely isn't recommended. It's not just about achieving strength—it's about staying strong and healthy for life.

MYTH

ALL I NEED IS CARDIO TO BURN MORE FAT!

Fact: Cardio burns calories, but strength training increases muscle mass, which boosts metabolism even at rest. A combination of both have been proven to be the best for fat loss and muscle maintenance. A short 20-minute conditioning session with your coach, online or offline, takes care of both if you are pressed for time.

MYTHS & FACTS

MYTH

I EAT LESS BUT STILL DON'T LOSE WEIGHT.

Fact: Losing weight isn't just about eating less, it's about burning more calories than you eat. If you eat too little, your body can go into "starvation mode," (craving for more food) slowing down your metabolism, making you feel tired, and even leading to muscle loss. Instead, aim for a healthy calorie deficit, focusing on nutritious foods that give you energy and help you maintain muscle while losing fat. A comprehensive plan from a qualified nutrition coach helps tremendously.

MYTH

ONLY WALKING IS ENOUGH FOR FAT LOSS

Fact: Walking is great for heart health, but strength training burns more fat over time. A mix of strength, cardio, and mobility work is best for weight management. A short 20-minute conditioning session with your coach, online or offline, takes care of both if you are pressed for time.

MYTH

DOING A LOT OF ACTIVITIES (YOGA, WALKING, CYCLING, ETC...) WILL BURN MORE CALORIES.

Fact: Low-intensity activities like yoga, walking, and cycling improve fitness but may not burn enough calories alone for significant fat loss. Strength training and high-intensity workouts boost metabolism, build muscle, and help burn fat more efficiently even when you're resting. A balanced mix of strength, cardio, and proper nutrition is the best approach for fat loss.

MYTH

CAN I LOSE FAT ONLY IN MY TUMMY?

Fact: Losing fat in one specific area by doing targeted exercises—is a lie, fat loss happens overall. Combine strength training (builds muscle and boosts metabolism), cardio (burns calories), and a calorie deficit (eat fewer calories than you burn). This approach will help reduce fat from your whole body, including your tummy .

MYTH

HOW FAST CAN I LOSE WEIGHT?

Fact: Safe and sustainable weight loss is 0.5-1 kg per week. Faster weight loss may lead to muscle loss, metabolic slowdown, and nutrient deficiencies.
